HALIA POCT

**QUALITY LEVEL REQUIRED FOR
PATIENT CARE AND DIAGNOSTIC
COVERAGE GUARANTEED**

THE CONTEXT

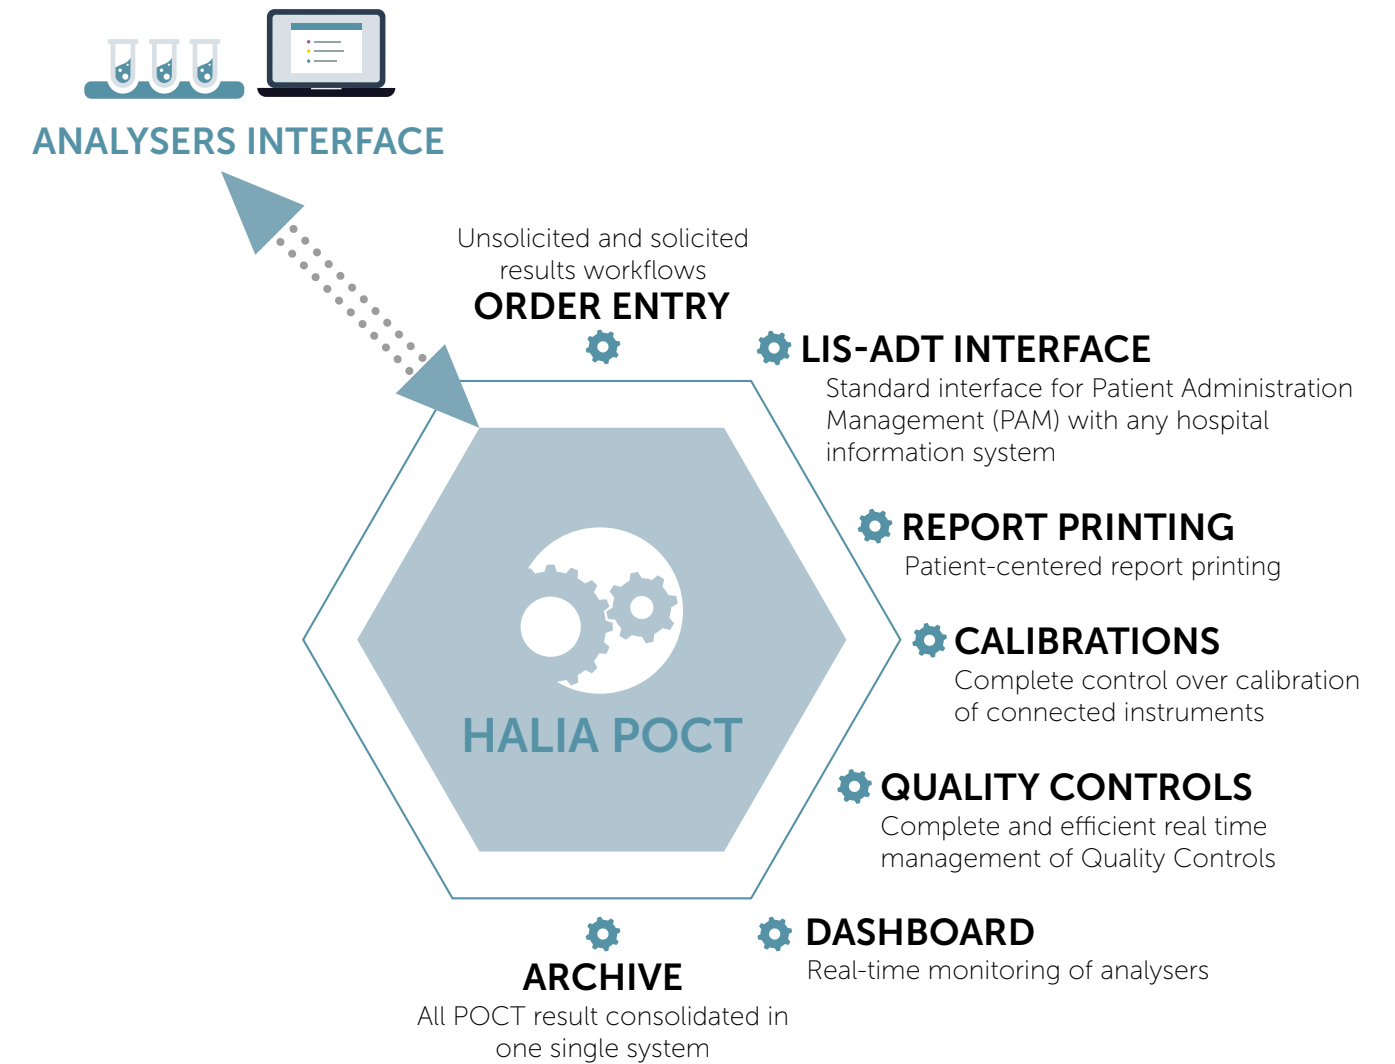

Point-of-Care Testing (POCT) has long been a feature of both ambulatory and in-patient settings. However, advances in technology have allowed for a greater variety in testing that can be undertaken by POCT devices.

Therefore, the areas covered by POCT have moved beyond critical situations, emergency room and intensive care to general primary care. This makes POCT a “near patient testing” point, being able to cover a full range of diagnostic parameters.

THE SOLUTION

HALIA POCT Data manager is a middleware module developed by Dedalus Group, supporting new organisational models for Point-of-Care Testing, based on the HALIA Clinical Laboratory, to perfect the specific diagnostic process of POCT by increasing flexibility and improving integration capabilities.

HALIA is compatible with any POCT device and guarantees complete integration with Laboratory and Hospital Information Systems, implementing both solicited and unsolicited result workflows.

All round control
of the POCT
workflow

Adherence to
international
standards for
interoperability

STRENGTHS

Decrease of
Turn-Around-Time
(TAT)

Enhanced
communication with
